

Algorithm and Dataset - E-Commerce Sales Analysis

Algorithm

1. Collect e-commerce sales data including products, customers, orders, ratings, payment methods, and delivery status.
2. Clean the dataset by removing duplicate and incomplete records.
3. Organize the data using SQL and Excel.
4. Analyze best-selling and least-selling products.
5. Compare sales across different regions and product categories.
6. Analyze customer ratings and reviews.
7. Evaluate stock availability and delivery performance.
8. Study customer payment methods and purchasing behavior.
9. Recommend strategies to improve sales of low-performing and newly launched products.
10. Create dashboards and prepare the final report.

Dataset

Source: Sample E-Commerce Sales Dataset.

Records: Use the actual number of rows in your Excel dataset.

Features: Order ID, Customer ID, Product Name, Category, Region, Price, Quantity, Rating, Payment Method, Delivery Status.

Data Format: Excel (.xlsx).

Training and Testing: Not Applicable (Business/Data Analysis project).
